Build a hybrid infrastructure that you control
Bring your own IP addresses and DNS servers
Secure your connections with an IPSec VPN or ExpressRoute

Gain granular control over traffic between subnets
Create sophisticated network topologies using virtual appliances
Get an isolated and secure environment for your applications

Virtual Network

Your private network in the cloud

ENHANCE SECURITY AND ISOLATION

Azure Virtual Network provides an isolated and secure environment to run your virtual machines and applications. You can use your private IP addresses and define subnets, access control policies, and more. With Virtual Networks, you can treat Azure just as you would your own datacenter.

BUILD SOPHISTICATED NETWORK TOPOLOGIES

Within a virtual network, you can choose to run a variety of network virtual appliances—WAN optimizers, load balancers, and application firewalls—and define traffic flows, allowing you to design the network with a greater degree of control.

EXTEND YOUR DATACENTER INTO THE CLOUD

With Virtual Network, you can easily extend your on-premises IT environment into the cloud, much the way that you can set up and connect to a remote branch office. You have multiple options to securely connect to a Virtual Network: you can choose an IPsec VPN or a private connection using the Azure ExpressRoute service.

CREATE HYBRID APPLICATIONS

With Virtual Network, you can build hybrid cloud applications that securely connect to your on-premises datacenter—so an Azure web application can access an on-premises SQL Server database or authenticate users against an on-premises Active Directory service.

Virtual machine availability

Across datacenters

VM replication with Hyper-V Replica

New: Configurable syncs down to 30 seconds

New: Tertiary site support

Seamless integration with Hyper-V and clustering

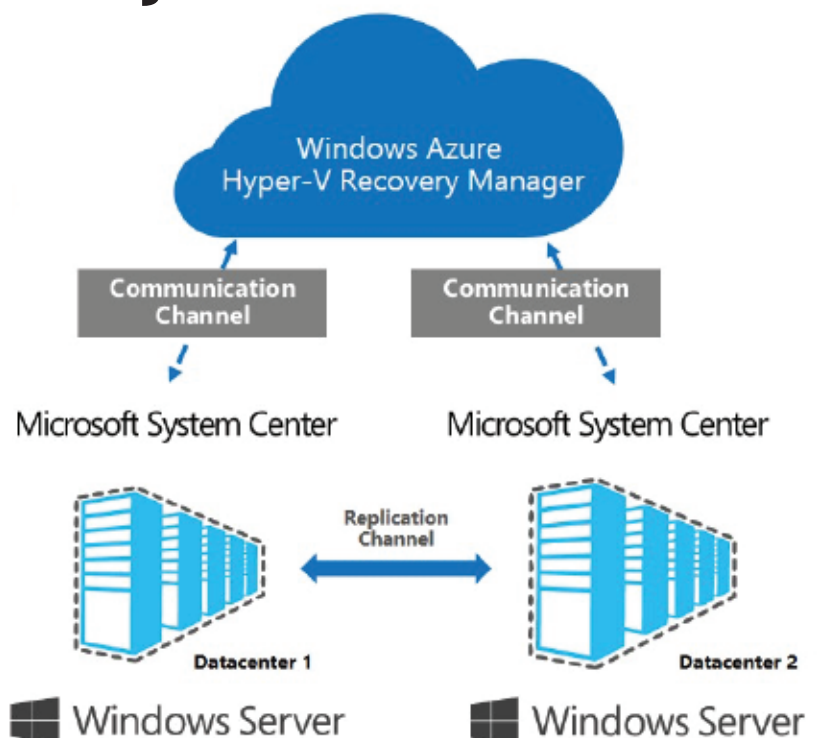

Recovery orchestration

With Windows Azure Hyper-V

Recovery Manager

At scale disaster recovery with Windows

Azure enabled process automation
